Prepared analogously as described under V).

mp: 203°.

**Y) 6-Hydroxy-4-methoxyquinazoline**

A mixture of 200 mg of 6-hydroxy-3H-quinazolin-4-one and 5 ml of phosphorylchloride is heated to reflux for 2 hours. The excess phosphorylchloride is distilled off in vacuo and the residue is taken up in a solution of sodium methoxide (prepared from 80 mg sodium) in dry methanol. After refluxing for 2 hours the solvent is distilled off and the residue is partitioned between aqueous pH7-buffer solution and ethyl acetate. The organic phase is separated, dried over magnesium sulfate and evaporated in vacuo. The crude product is directly used in the next reaction or purified by chromatography on silica gel.

SW-480	= human colon carcinoma cell line
DMEM	= Dulbecco's modified eagle medium
EGF	= epidermal growth factor

**1. Inhibition of proliferation in the human keratinocyte cell line HaCaT:**

HaCaT cells, a spontaneously transformed, TGF $\alpha$ - and EGF-receptor positive non-tumorigenic human keratinocyte cell line with highly preserved phenotypic differentiation characteristics of normal keratinocytes (Boukamp et al., J. Cell. Biol. 106: 761-771[1988]), are cultivated in DMEM medium supplemented with 2.2 g/l NaHCO<sub>3</sub>, 0.11 g/l sodium pyruvate, 15 mM Hepes, 5% fetal calf serum (FCS), penicillin (100 U/ml), streptomycin (100  $\mu$ g/ml), and glutamine (to increase the final concentration by 4 mM). For the proliferation assay, cells are detached by trypsinization, suspended in fresh medium, and seeded into 96-well microtiter plates at 2000 - 4000 cells/0.2 ml/well. After 24 hours the medium is replaced with fresh medium containing graded concentrations of test compound. After 3-4 days of incubation, the extent of cellular proliferation is measured by a colorimetric assay

using sulforhodamine B (Skehan et al., J. Natl. Cancer Inst. 82: 1107-1112 [1990]). The results represent the average  $\pm$  standard deviation of three measurements.

In this test the compounds of the invention inhibit cell proliferation with  $IC_{50}$ -values ranging from about 0.003  $\mu$ M to about 3  $\mu$ M.

## **2. Inhibition of tumor cell proliferation:**

Tumor cell lines, for example A375, A549, HeLa-O, MDA-MB-231, SW-480, MDA-MB 435 and HT-29, available from American Type Culture Collection, are grown in medium supplemented with 5 to 10% heat inactivated (56° C/30 min) FCS and antibiotics. At the time of 60-90% confluence the cells are harvested, trypsinized, suspended in fresh growth medium and seeded into 96 well cell culture plates at concentrations ranging between 1000 and 5000 cells/well. Cells are grown for 3 - 4 days in a final volume of 0.2 ml/well, at 37° C in an humidified incubator equilibrated with 5% CO<sub>2</sub>, in the presence of graded concentrations of test compound. Extent of cellular proliferation is measured by a colorimetric assay using MTS (Buttke et al., J. Immunol. Meth. 157: 233-240 [1993]) for cells growing in suspension or by sulforhodamine B for adherent cells. In this experimental system the compounds of this invention inhibit cell proliferation with  $IC_{50}$  ranging between 0.01 and 5  $\mu$ M.

The compounds of the invention are therefore indicated for use as antiproliferative /antiinflammatory and anticancer agents in the treatment of proliferative/inflammatory disorders and cancer such as in suppression of neoplastic diseases, e.g. inflammatory/proliferative skin diseases and skin cancer, and autoimmune diseases, such as: psoriasis, atopic dermatitis, contact dermatitis and related eczematous dermatitises, seborrheic dermatitis, Lichen planus, Pemphigus, bullous Pemphigoid, Epidermolysis bullosa, urticaria, angioedemas, vasculitides, erythemas, cutaneous eosinophilias, Lupus erythematosus and Alopecia areata.

For this use the dosage to be used will vary, of course, depending e.g. on the particular compound employed, the mode of administration and the treatment

desired. However, in general, satisfactory results are obtained when the compounds are administered at a daily dosage of from about 1 mg/kg to about 30 mg/kg animal body weight, suitably given in divided doses two to four times daily. For most large mammals the total daily dosage is from about 70 mg to about 2000 mg, conveniently administered, for example, in divided doses up to four times a day or in retard form. Unit dosage forms comprise, for example, from about 17.5 mg to about 1000 mg of the compounds in admixture with at least one solid or liquid pharmaceutically acceptable carrier or diluent.

The compounds of the invention may be administered in similar manner to known standards for use in such indications. The compounds may be admixed with conventional chemotherapeutically acceptable carriers and diluents and, optionally, further excipients, and administered e.g. orally in such forms as tablets and capsules.

Alternatively, the compounds may be administered topically in such conventional forms as ointments or creams, parenterally or intravenously. The concentrations of the active substance will, of course vary depending e.g. on the compound employed, the treatment desired and the nature of the form. In general, however, satisfactory results are obtained, e.g. in topical application forms at concentrations of from about 0.05 to about 5%, particularly from about 0.1 to about 1% by weight.

Pharmaceutical compositions comprising a compound of the invention together with at least one pharmaceutically acceptable carrier or diluent also form part of the invention, as well as a process for the preparation thereof by mixing together with at least one pharmaceutically acceptable carrier or diluent. The invention also comprises the compounds of the invention for use as pharmaceuticals, especially in the prevention or treatment of inflammatory and proliferative skin illnesses and cancer.

The invention further comprises a method of prevention or treatment of inflammatory and proliferative skin diseases and cancer, which comprises administering a

therapeutically effective amount of a compound of the invention to a subject in need of such treatment.

The compounds of the invention of formula Is and especially the compounds of formula I<sub>ss</sub> are particularly preferred.

The compounds of example 6, 16 and 17, namely 6-[2-(2,5- dimethoxyphenyl)ethyl]-4-ethyl-quinazoline and, respectively, the corresponding 4-methoxy and 4-methyl compounds, are the most preferred compounds as antiproliferative/antiinflammatory and anticancer agents, especially the compound of Example 6. It has, for example, been determined that in the above test 1 these 3 compounds have an IC<sub>50</sub> of about 10 nM, in the above test 2 an IC<sub>50</sub> between 10 and 200 nM.
